

Creative Workshop Admin Portal

Product Requirements Document — Enhanced End-to-End Specification

Platform: Responsive web application (mobile-first in the studio, desktop-optimised for planning and printing)

Version: 2.0 (enhanced revision of the original v1.0 feature specification)

Date: August 4, 2026

Author: Product Owner / Founder

Status: Draft for review

This document preserves the six modules of the original specification and upgrades each one with richer, more personality-driven functionality. It is written so that developers, designers, and agency partners can understand exactly what to build, how it should feel, and how every module connects into one end-to-end hosting workflow.

1. Overview and Summary

The **Creative Workshop Admin Portal** is an all-in-one administrative platform for independent creative workshop hosts — pottery and wheel-throwing instructors, bento cake decorators, and ceramic painting studios. It replaces the patchwork of spreadsheets, notes apps, chat threads, and last-minute design tools that hosts currently juggle, and folds seat tracking, scheduling, guest management, prep checklists, print-ready name tags, and automated reminders into a single warm, aesthetic experience. The product should never feel like back-office software; it should feel like a supportive studio assistant that shares the host's taste and tone of voice.

Target users. Solo hosts and very small teams (one to three people) who run recurring classes of roughly six to sixteen guests. They manage most of their business from a phone between classes, handle guest communication personally, and care deeply about how everything — including their admin tools — looks and feels. Many are building a personal brand alongside the workshop business.

Problem being solved. Hosting a single workshop involves dozens of small, easy-to-drop details: remembering who booked, tracking a nut allergy, baking cake bases a day early, printing name tags the night before, texting guests directions, and following up afterwards. Today these live in the host's head and across disconnected tools, which produces stress, forgotten prep, no-shows, and hours of repetitive manual work per event. The portal automates the operational memory of the business so hosting feels smooth, organised, and genuinely enjoyable.

Platform. A responsive web application. The phone experience is optimised for glanceable, in-studio use (checking prep, reviewing the roster, ticking tasks); the desktop and tablet experience is optimised for planning sessions, designing name tags, and printing. No native mobile apps are required for version one.

What changed in this revision. Version 2.0 keeps the original six-module structure intact and deepens each module: the dashboard becomes celebratory and shareable, the calendar protects the host's energy, the name tag studio grows into a full matching event kit with seasonal theme drops, customer management gains a memory for regulars, checklists scale quantities automatically and reward consistency, and the reminder engine gains selectable personality voices and a friction-free feedback loop.

2. Functional Requirements

The requirements below are organised module by module, following the structure of the original specification. Each module describes its purpose, the primary user flow, core behaviours (including the new enhancements), and the edge cases the build must handle. All modules read and write against one shared data model: a **Session** (a scheduled class) that owns its roster, checklist, seating plan, name tag set, and message schedule. Section 2.7 walks through the complete end-to-end journey that ties the modules together.

2.1 Module 1 — The Daily Overview (Dashboard)

Purpose. The dashboard is the host's mission control: one screen that answers "what is happening, what needs me, and how am I doing" the moment the app opens. In this revision it also becomes emotional and celebratory — a place that makes the host feel proud of their business, not just informed about it.

User flow

The host opens the app (typically on a phone, first thing in the morning). A personalised greeting sets the tone, the next upcoming workshop is summarised in a snapshot card with live capacity, the prep tracker shows exactly what is due today, and an alert feed surfaces anything time-critical. Every element deep-links directly to the screen where the host can act on it.

Core behaviours

Vibe-check greeting. A context-aware welcome line generated from the day, time, and schedule, drawn from a rotating copy library so it never feels repetitive. Examples of the intended tone:

"Good morning! It's kiln day — two things need you before noon." / "Quiet day today. Perfect time to plan something lovely." / "Class in 4 hours. You've got this."

The greeting adapts to workload (busy day vs. rest day) and can be toggled off in settings for hosts who prefer a plain header.

Current workshop snapshot. A hero card for the next upcoming session showing the class name, date and time, and a visual capacity ring (for example, 8 of 10 seats booked). The ring changes state by fill level: open, filling, nearly full, and sold out. Selling out triggers a one-time confetti micro-animation and adds a collectible "Sold Out" moment to the host's milestone history. The card carries three quick actions — *Print Name Tags*, *View Guest List*, and *Adjust Seat Count* — that jump straight into Modules 3, 4, and 2 respectively with this session pre-selected.

Smart prep task tracker. A dedicated section listing every prep step due for the upcoming workshop (sourced live from Module 5), each with an interactive checkbox. Ticking items animates a progress bar and updates encouraging copy such as "4 of 5 prep steps done — nearly there!". Items past their deadline are visually flagged and pinned to the top.

Alert and nudge feed. Friendly notification cards with two priority tiers. Critical alerts (kiln loading deadlines, an unassigned guest on event day, a failed reminder message) render in terracotta and pin to the top; gentle nudges render in soft pastel below. Every alert is actionable — tapping it opens the exact screen where the issue can be resolved. Example copy:

"Kiln alert: load Saturday's clay pieces by 6 PM today." / "Two guests still have no table — assign them before printing tags?"

Weekly recap card ("Your Week, Wrapped"). Every Sunday evening the dashboard generates a beautifully designed summary card: guests hosted this week, classes run, sellouts, prep completion streak, and one highlight stat (for example, "You've now taught 214 people to decorate cakes"). The card is rendered in a tall story-friendly format so the host can screenshot and share it directly to social media. Milestones (100th guest, fifth sellout, ten perfect prep weeks) trigger a full-screen celebration with a collectible badge added to the host's profile.

Edge cases

With no upcoming sessions, the dashboard shows a warm illustrated empty state ("Nothing scheduled yet — plan something lovely?") with a shortcut to the calendar's quick-add flow. When all prep is complete, the tracker switches to a celebratory "All set for Saturday!" state rather than an empty list. If multiple sessions occur on the same day, the snapshot becomes a horizontally swipeable stack ordered by start time.

2.2 Module 2 — Interactive Drag-and-Drop Calendar

Purpose. A flexible visual schedule that replaces static lists, makes rescheduling painless, and — new in this revision — actively protects the host from over-scheduling and burnout.

Core behaviours

Views and colour coding. Month and week views on desktop and tablet; a clean agenda list on mobile. Each workshop type carries its signature colour — Bento Cake Decorating in soft pastel pink, Pottery and Wheel Throwing in warm terracotta, Ceramic Painting in sage green — and custom class types created by the host pick a colour from the brand palette so the calendar always stays cohesive.

Drag-and-drop rescheduling. The host drags a scheduled class to a new day or time. A confirmation modal summarises the impact before anything is saved: the new slot, the number of booked guests affected, and any prep deadlines that will shift. It then offers one-tap guest notification ("You moved Saturday's class to Sunday. Notify the 8 booked attendees?") which routes through the reminder engine (Module 6) using a pre-filled, editable schedule-change template. All checklist deadlines for the session automatically re-anchor to the new start time.

Live slot adjustment. Tapping any class opens a quick-edit panel: increase or decrease seats, change time or duration, or lock the session to stop new bookings (locked sessions display a "Fully booked" state wherever guests are added). Increasing seats when a waitlist exists immediately offers to invite the next person in line (Module 4). Decreasing seats below the current booking count is blocked, with a clear explanation of why.

Quick-add session. Tapping any blank date launches a lightweight modal: choose the class type (which pre-fills the colour, default capacity, and craft-specific checklist template), set the time and seat count, and save. The modal supports simple recurrence (repeat weekly until a chosen end date) so a regular Saturday class can be created once.

Energy budget layer. The host can mark any day as a **Rest Day**, which renders with a soft protected pattern on the calendar. Attempting to schedule onto a rest day triggers gentle friction — "This is your rest day. Schedule anyway?" — that can always be overridden; the system cares, it never controls. In settings, the host sets a personal weekly class cap; when a new session would exceed it, or when three or more classes land back-to-back within a tight window, the calendar shows a kind burnout warning ("Three classes in a row is a lot. Want to space these out?"). These prompts are informational only and never block saving.

Edge cases

Dragging a session into the past is prevented with a friendly explanation. Overlapping sessions are allowed (some hosts run parallel stations) but visually flagged so overlaps are always intentional. All times follow the studio's configured time zone. Deleting a session with booked guests requires typed confirmation and offers the guest-notification flow before removal.

2.3 Module 3 — Automated Name Tag Studio and Event Kit

Purpose. An in-app design studio that turns booking data into print-ready, on-brand name tags in minutes. In this revision it expands from name tags into a coordinated **event kit** — tags, table cards, a welcome sign, and social templates in one matching design language — because a beautifully art-directed event is the host's best marketing.

User flow

The host selects an upcoming session; the studio automatically pulls every participant's name, assigned table or station number, and their answers to any custom booking questions. The host picks a theme, adjusts toggles, reviews a live preview of the full tag set, and exports a print PDF — a journey that should take under three minutes end to end.

Core behaviours

Aesthetic theme presets. Three signature themes ship at launch: *Coquette and Ribbon* (soft pinks, bow illustrations, cursive accents — ideal for bento cake classes), *Clay and Terracotta* (warm earthy tones, organic clay shapes, rustic typography — ideal for pottery), and *Pastel Minimalist* (clean line-art florals, sage and cream palette, modern type — ideal for ceramic painting).

Seasonal theme drops. Limited-time theme packs release through the year — a spring garden set, a summer picnic set, a spooky-but-cute October set, a festive December set — each appearing in the studio with a "New" badge for its season. Drops give hosts a reason to return, keep events feeling current, and create natural social-media moments. Past seasonal tags remain re-printable for sessions that already used them.

Personal touches from booking data. Fun answers collected at booking (for example "my favourite flavour is..." or "this is my first pottery class!") can appear as subtext beneath each guest's name. Every tag supports per-guest overrides: fix a spelling, hide one guest's subtext, or swap an individual tag's accent colour without leaving the batch.

Customisation toggles. Global show/hide switches for table number, custom subtext, and the host Instagram QR code. The QR code auto-generates from the handle stored in the host's **brand kit** — a one-time setup where the host uploads a logo, sets brand colours, and saves their social handle;

the kit then applies consistently across every theme and every kit piece.

Matching event kit. Alongside tags, each theme generates coordinated *table number cards*, an A4 or A3 *welcome sign* ("Welcome to Saturday's Bento Cake Workshop"), and two to three *Instagram story templates* announcing the event in the same design language. One click art-directs the entire event.

Batch print and layout options. An A4 grid view arranging 8 or 10 tags per page with faint trim marks; sticker-sheet layouts matched to standard pre-cut label paper; and a single-tag thermal view formatted for small desktop thermal sticker printers. A one-click **Export to Print PDF** produces the final file, and any individual tag can be re-exported alone for walk-ins or late additions.

Edge cases

Very long names scale their type down automatically rather than wrapping awkwardly. If table assignments are missing, the studio prompts the host to assign them (deep-linking to Module 4) or hide table numbers for this batch. If the roster changes after an export, a banner appears on the session — "Roster updated since your last export — re-export tags?" — so the printed set never silently drifts out of date.

2.4 Module 4 — Customer and Booking Management

Purpose. The centralised guest database: who is coming, what they need, where they sit, and — new in this revision — who they *are* over time. The module gives a solo host the superpower of remembering every guest like a favourite regular.

Core behaviours

Attendee roster. A searchable list of all guests, filterable by workshop date, class type, status (confirmed, waitlisted, cancelled, attended), or name. Each guest has a profile holding contact details, preferred message channel, full visit history, credits, and notes. Duplicate detection merges records that share a phone number or email so history never fragments.

Dietary and special notes. Structured, highlighted fields rather than free text alone: allergy chips (a nut allergy renders as a red-outlined chip) surface everywhere they matter — the roster, the seating map, the printed host copy of the guest list, and as a day-of dashboard alert ("Ayesha at Table 2 has a nut allergy"). Celebration flags (birthday, anniversary) display a small icon and prompt the host with a suggested gesture, essential for food-based classes and delightful everywhere else.

Regulars and memory. The system counts visits automatically and awards friendly badges on the roster ("3rd visit") with a dedicated *Regulars* filter. A thirty-day birthday lookahead surfaces upcoming guest birthdays with a one-tap suggested action, such as sending a discount or free-seat invitation through a reminder template. A freeform mini-CRM note on each profile ("came with her sister; loved the matcha buttercream") appears automatically the next time that guest books and on the day-of roster, so personal recognition scales beyond the host's memory.

Table and seat planning. A visual table map per session: drag guests onto tables or stations, or assign via dropdown on mobile. Sit-together requests can be noted on any booking, and an unassigned-guest counter keeps the plan honest. Assignments flow directly into the Name Tag

Studio.

Waitlist management. When a session reaches capacity it automatically opens an ordered waitlist. When a seat frees up — through a cancellation or a seat increase from the calendar — the host taps *Invite Next*, or enables auto-invite, in which the next person receives an invitation with a response window (default twelve hours) before the offer passes down the list. Waitlisted guests can receive position updates so they are never left wondering. Auto-invites respect the quiet-hours rules defined in Module 6, so no one is invited to a class at three in the morning.

Cancellations and rain-check credits. Cancelling a guest prompts a choice: mark as refunded (money handled off-platform in v1) or issue a one-tap **class credit**, which sends a warm automatic message ("Life happens! Your seat credit is saved for next time.") and records the credit on the guest's profile, where it is clearly visible and applicable at their next booking. This turns an awkward refund conversation into a retention moment.

Edge cases

Guests may be added manually by the host (from direct messages or phone bookings) with only a name if needed; missing contact details simply exclude that guest from automated messages, with a visible badge explaining why. Guest data can be exported, and a full delete honours privacy requests by removing personal data while preserving anonymised attendance counts.

2.5 Module 5 — Prep Checklists and Operational Memory

Purpose. The system that guarantees nothing is forgotten — before *or* after class. This revision makes checklists quantity-aware, extends them past the event into cleanup and reset, and rewards the host's consistency with streaks and badges.

Core behaviours

Craft-specific templates with T-minus timing. Every class type owns a default checklist that is instantiated automatically the moment a session is scheduled, with each item anchored to the session start time. For bento cake: bake bases (T-24h), chill piping bags (T-4h), set out sprinkles (T-1h). For pottery: wedge clay (T-24h), fill water buckets (T-2h), set out sponges and trimming tools (T-1h). Templates are fully editable — hosts can add, remove, reorder, and retime steps — and edits can apply to the template, a single session, or both.

Smart quantity scaling. Checklist items may reference the live seat count using a simple variable, for example "Bake {seats + 2} cake bases". When capacity changes from ten to twelve in the calendar, the item text updates automatically — and if a quantity-linked item was already checked off, the system re-opens the conversation kindly: "You added 2 seats — you may need 2 more cake bases." Prep and capacity can never silently drift apart.

Deadline warnings. A two-stage escalation: a gentle nudge when an item's T-minus moment arrives, and a stronger alert — push notification plus a pinned terracotta card on the dashboard — if a high-priority item remains unchecked within a configurable window before class start.

Custom steps and one-off notes. Any session can carry ad-hoc items ("buy extra gold sprinkles for Sana's birthday cake") that live only on that date and never pollute the template.

Host streaks and badges. Completing one hundred percent of prep before class start extends a prep streak; milestones unlock playful collectible badges (for example, "Ten Perfect Preps"). Gamification here is purely celebratory — a broken streak resets quietly with no shame copy, because the feature exists to make consistency feel good, not to punish a busy week.

Post-class reset list. Each craft template can include an optional after-class checklist — unload the kiln, wash piping tips, restock aprons, note supplies running low — that activates once the session ends. Operational memory now covers the full cycle: prepare, host, reset.

Edge cases

Rescheduling a session shifts every T-minus deadline automatically and re-plans any pending warnings. Deleting a session archives its checklist rather than destroying it, preserving the host's completion history and streak record. Items with past deadlines on newly created last-minute sessions are marked "due now" rather than generating a backlog of overdue alarms.

2.6 Module 6 — Cute Automated Reminders (Guest and Host)

Purpose. The messaging engine for all pre- and post-workshop communication. This revision gives it a selectable personality, a respectful sense of timing, and a feedback loop so light that guests actually complete it.

Core behaviours

Guest reminders across channels. Messages send over SMS, WhatsApp, or email according to each guest's preferred channel. Twenty-four hours before class, guests receive event details, location and parking information, what to wear, and a gentle dietary-needs confirmation. Twenty-four hours after class, a thank-you follows with the feedback ask and an invitation to tag the studio in photos.

Personality voice presets. Every template exists in three tones the host chooses between as their default voice — *Soft and Sweet*, *Chaotic Bestie*, and *Clean and Minimal* — with per-message overrides. The same reminder, three ways:

Soft and Sweet: "We can't wait to see you tomorrow at 2 PM! Wear something comfy — aprons are on us."

Chaotic Bestie: "BESTIE. Tomorrow. 2 PM. Cake. Be there. (Wear clothes you can get frosting on.)"

Clean and Minimal: "Reminder: Bento Cake Workshop, tomorrow 2:00 PM. Aprons provided. Address below."

Customisable template editor. Full control of copy, emoji density (none, light, or full), and friendly phrasing, with insertable variables such as guest name, class name, time, address, and table number, a live preview per channel, and a test-send-to-self button so nothing goes out unseen.

Effortless feedback loop. The post-class thank-you embeds a three-emoji tap rating and a single prompt: "describe today's class in one word." Responses collect on a simple feedback view per session, giving the host honest signal and quotable words without ever sending guests a survey form.

Host operational reminders. Friendly in-app and push notifications tied to the prep schedule and day-of rituals, with configurable lead times: "Class starts in 3 hours — name tags printed and aprons out?" These are generated from Module 5 deadlines and the session timeline, so hosts configure them once.

Smart send windows. All guest-facing messages respect quiet hours (default 9 AM to 9 PM in the studio's time zone); anything triggered outside the window queues for the next opening. Reschedule notifications initiated from the calendar route through this engine with a pre-filled schedule-change template that the host reviews and confirms before sending — automated, never unsupervised.

Edge cases

Failed sends retry automatically, then surface in the dashboard alert feed with the affected guest and a retry action. Guests who opt out of messages are excluded from sends and badged on the roster so the host knows to reach them personally. Every message sent to a guest is logged on their profile for a complete communication history.

2.7 The End-to-End Flow — How the Modules Connect

A single narrative ties the system together and defines the integration contract between modules. The host creates "Saturday Bento Cake, 10 seats" with a tap on a blank calendar date (Module 2). The craft template instantly generates the session's prep checklist with deadlines anchored to Saturday (Module 5). As bookings arrive, the host adds guests, captures dietary notes and fun booking answers, and drags everyone onto tables (Module 4); the dashboard's capacity ring fills in real time (Module 1). When seat ten books, confetti fires, the session locks a waitlist open, and the "Sold Out" milestone is recorded. Twenty-four hours out, guest reminders send in the host's chosen voice while prep nudges keep the checklist on schedule (Module 6). The host opens the Name Tag Studio, picks the seasonal theme, and exports tags, table cards, and the welcome sign in one batch (Module 3). On the day, the dashboard surfaces the nut allergy at Table 2 and confirms all prep complete. After class, the thank-you and one-word feedback go out, the post-class reset list appears, and on Sunday evening the weekly recap card celebrates the week — ready to screenshot. Every module reads from the same Session record; nothing is entered twice.

3. Non-Functional Requirements

3.1 Performance

The dashboard must load in under two seconds on a mid-range phone over a 4G connection, since it is opened many times a day in the studio. Name tag and event kit PDF exports must complete within five seconds for a sixteen-guest session. Calendar drag interactions and checklist animations must remain smooth (targeting 60 frames per second) on mobile devices.

3.2 Reliability

Scheduled reminders are the product's core promise and must deliver within five minutes of their target time; the platform targets 99.5 percent uptime. Any delivery failure must be visible to the host through the alert feed — silent failure is treated as a critical defect.

3.3 Security and privacy

Guest records contain personal contact details and health-adjacent information (allergies and dietary restrictions), which must be encrypted in transit and at rest. Access requires authenticated host login; there is no public guest-facing surface in version one. Per-guest data export and deletion must be supported to honour privacy requests. Messaging integrations must comply with channel policies, including WhatsApp Business messaging rules and SMS opt-out handling, with opt-outs enforced automatically.

3.4 Accessibility

The interface targets WCAG 2.1 AA. The pastel brand palette must still achieve a 4.5:1 contrast ratio for body text — in practice, deep cocoa and clay tones on cream backgrounds rather than pale-on-pale. All celebratory animations (confetti, sparkle checkboxes) respect the reduced-motion system preference, sound effects are off by default and toggleable, and touch targets are at least 44 pixels for in-studio use with clay-dusted fingers.

3.5 Compatibility and scalability

The application supports current evergreen browsers on phone, tablet, and desktop through responsive breakpoints. Printing relies on generated PDFs rather than browser print styling, guaranteeing identical output across devices. The data model must remain fast with several years of history — hundreds of sessions and thousands of guest records per host — without degraded search or dashboard performance.

4. Success Metrics and KPIs

Success means the portal becomes the host's daily habit and measurably removes operational pain. The metrics below combine adoption, reliability of the operational promise, and business impact for the host.

Metric	Definition	Target
Activation rate	New hosts who schedule a class and export name tags within 7 days of signup	60 percent or higher
Weekly active hosts	Hosts opening the app in a given week (of hosts with an upcoming session)	85 percent or higher
Prep completion rate	Sessions with 100 percent of checklist items done before start time	90 percent or higher
Name tag time saved	Median time from opening the studio to exported PDF (vs. ~45 min manual)	Under 3 minutes
No-show reduction	Change in guest no-show rate after reminders are enabled	30 percent reduction
Feedback response rate	Guests completing the emoji-plus-one-word follow-up	50 percent or higher
Repeat-guest rate	Guests attending a second class within 90 days	Uplift vs. host baseline
Recap card shares	Weekly recap cards screenshotted or shared per active host	Tracked; 25 percent of hosts monthly

Qualitatively, host NPS is measured quarterly with one added question — "does the app feel like part of your brand?" — because the emotional positioning is a stated product goal, not decoration.

5. Out of Scope (Version 1)

The following are explicitly excluded from this release to protect focus and timeline. Several are strong candidates for the next major version and are noted as such.

Payment processing. The portal tracks bookings, cancellations, and class credits, but money itself (charges, refunds, payouts) is handled off-platform in v1.

Public guest-facing booking page. Guests are entered by the host in v1; a beautiful public booking site in the host's theme is the highest-priority v2 candidate.

Post-class content studio. Automated photo carousels, caption generation, and shared guest albums are deferred to a future marketing-focused release.

Finance and supplies module. Per-class profitability, expense tracking, and supply-level reordering are out of scope; v1 limits itself to the free-text low-supplies note on the post-class reset list.

Multi-host collaboration. Co-managed events between two hosts, shared rosters, and split checklists are deferred; v1 supports a single studio account with optional staff logins as an open question.

Native mobile applications. The responsive web app covers phone use in v1; app-store distribution is a later decision informed by usage data.

AI-generated message copy. Templates and voice presets are hand-crafted in v1; free-form generated copy is not included.

6. Open Questions

Booking origin. The specification assumes the host enters bookings manually (from direct messages, calls, or in person). Should v1 also import bookings from an external form tool, or is manual entry acceptable until the public booking page ships? This is the largest unresolved product decision.

Messaging provider and cost. WhatsApp Business API access, sender registration, and per-message SMS costs vary significantly by country and provider. A provider (direct API vs. aggregator) must be selected early, as it shapes template approval workflows and the unit economics of reminders.

Sticker and thermal printing standards. Which pre-cut label sheet standards and which thermal printer models are certified for v1? A short compatibility list should be validated with real hardware during beta.

Seasonal theme pipeline. Theme drops require recurring illustration work. Is this an internal design commitment (roughly four packs per year) or a commissioned pipeline, and what is the lead time per pack?

Staff access. Do solo hosts with an occasional assistant need a second limited login (checklists and roster only, no settings) in v1, or is a shared login acceptable at this scale?

Quiet-hours defaults and localisation. Confirm default quiet hours, date formats, and currency display per market at beta, along with any data-residency requirements for guest records.

Launch timing and sign-off owners. No target launch date or named approvers were provided; the timeline below uses relative phases, and the sign-off table lists roles with names to be filled in.

7. Timeline and Milestones

No fixed launch date has been set, so phases are expressed in relative weeks from project start. The build order follows the data model: sessions and guests first, since every other module hangs off them.

Phase	Timeframe	Focus
Discovery and design	Weeks 1–3	Design system (palette, cards, motion, voice guidelines), data model, clickable prototype of dashboard and calendar
Phase 1 — Core operations	Weeks 4–8	Sessions and calendar (incl. drag-and-drop, energy layer), guest database, seating, waitlist, dashboard snapshot and alerts
Phase 2 — Studio and prep	Weeks 9–12	Name Tag Studio with three core themes, event kit pieces, PDF export pipeline, checklist engine with quantity scaling and warnings
Phase 3 — Voice and delight	Weeks 13–16	Reminder engine with channels, voice presets and quiet hours, feedback loop, recap cards, streaks, badges, celebration moments
Beta	Weeks 17–18	Three to five real hosts run a full live workshop cycle end to end; validate printing hardware and message deliverability
Hardening and launch	Weeks 19–20	Fixes from beta, accessibility audit, performance pass, public launch

The seasonal theme drop cadence begins after launch, with the first pack timed to the nearest upcoming season.

8. Sign-offs

Approver names were not specified and should be filled in by the product owner before circulating for signature.
